

## Connection to the Microsoft Active Directory G-SIM/ActiveDirectory

- Automatic authentication of users via the Windows password.
- Simple linking of Windows Active Directory user groups with G-SIM user groups.
- Different rights can be defined for different Active Directory and G-SIM groups.
- G-SIM groups can be linked to one or more Active Directory Group/s (group matching).
- Automatic synchronization of users and user groups.

This option allows the connection between Windows user groups and G-SIM user groups. This facilitates the administration of users, groups and rights in G-SIM. The user rights of each group in G-SIM can be defined in each case. When Windows authentication is activated a G-SIM password is no longer required.

In systems with many users, the G-SIM/ActiveDirectory option makes it easier to manage access and rights.

# Technical data

## G-SIM/ActiveDirectory

Option for the provision of a connection to Microsoft Active Directory. For easier management of users, groups and rights with the Security Information Management System (G-SIM).

Order No. 8.34370
