Activation G-SIM Server Failover
G-SIM/ServerFailover

- High reliability due to the automatic functional takeover of another G-SIM server in the network.
- Downtimes are minimized.
- The use of several G-SIM servers with adjustable prioritization is possible.
- Simple installation and parameterization.

This option enables the failover function of the G-SIM server. If one server fails, its full functionality like rights, connections and functions is taken over by a second server. This minimizes your downtime by immediately restoring your system.

For medium-sized or larger systems we recommend that you use two servers, as that is an easy way to give the system redundancy.
